

ABSTRACT OF THE DISCLOSURE

A configuration program running on a remote server, used for configuring a security system. The server may exchange voice commands with the user of the security system on the same
5 telephone line on which data is being exchanged. The configuration program obtains data regarding the security system and then, based upon the data, may alter the menu structure presented to the user. The said data may include a list of components installed in the security system. The user may record labels, voice or otherwise, which may then be downloaded to the security system. The security system may output any said voice labels through a speaker or audio
10 transducer. The server and security system may authenticate each other prior to exchanging configuration data.
